A trading wallet for Solana Seeker and any Android phone

You won more than you *kept.*

Kept saves part of every win for you, the moment you win it.

The problem

Traders do not have a picking problem. They have a *keeping* problem.

5.06 SOL

won by one real wallet on 147 winning sales in 90 days

16.73 SOL

given back by the same wallet on its losing sales

A take profit order does not help. The SOL lands in the same wallet and funds the next buy.

What Kept does

Part of every win, *put away.*

1

Sell for more than you paid

You trade as usual, in Kept or in any other app.

2

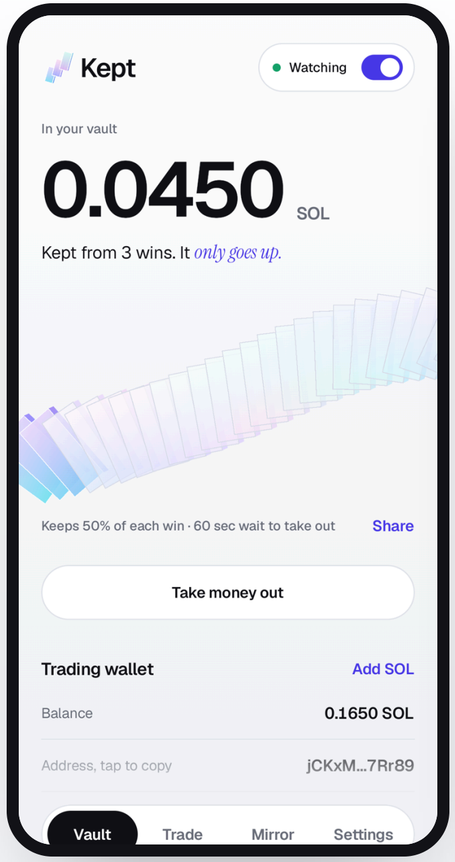

The phone moves your share

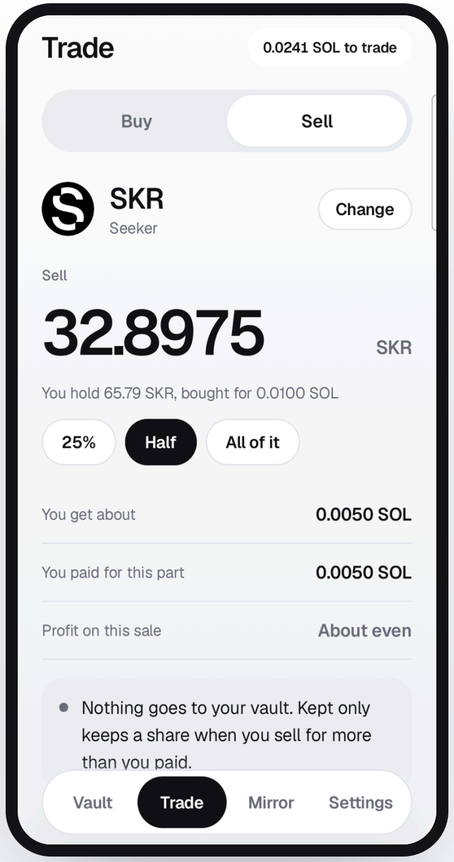

Half the profit by default, in about two seconds, with no tap.

3

Taking it out takes a wait

You ask, then wait the time you chose. You can cancel. You cannot skip it.

How it works

Two wallets, and each can only do *one thing.*

a

The trading wallet lives on the phone

Its key is locked in the phone's secure hardware. The vault program lets it put money in, and nothing else.

b

Your own wallet owns the vault

The Seed Vault on a Seeker, or any wallet app. It is the only one that can take money out, after the wait.

c

Swaps are checked before they are signed

Every transaction the swap service returns is read on the phone and refused unless it is a plain swap for your wallet.

d

Every win kept is a record on Solana

Tied to the sale that caused it. The proof page reads them live.

Why it belongs on a Seeker

The phone is the *product.*

1 **Mobile Wallet Adapter**

Connects the wallet that owns the vault. On a Seeker that is the Seed Vault, confirmed with a double tap.

2 **The phone's secure hardware**

Holds the trading key, so the phone can act the second you win and no server ever holds a key.

3 **SKR, used for something real**

Hold 100 SKR to choose your own share. Or keep each win as staked SKR, staked in the vault's name with Solana Mobile's own staking program, so the wait earns.

What is proven, and what is not

Nothing here is claimed that was not *seen.*

Vault program	**Live on mainnet**	44,992 bytes, written without a framework. 27 tests including attacks.
Setup, add SOL, buy, sell	**Mainnet, real phone**	Samsung Galaxy S22 Ultra with Phantom. A losing sale moved nothing.
Keeping a win	**Devnet, real phone**	Kept about two seconds after each winning sale, no tap. 14 on the proof page.
Taking money out	**Devnet**	Ask, wait, collect, cancel.
A kept win on mainnet	**Not yet**	Needs a real winning sale. Same program, same bytes as devnet.
Seed Vault on a Seeker	**Not tested**	No Seeker was available. The app uses standard Mobile Wallet Adapter.

Why it sticks

It acts at the moment you *win.*

1 **The Mirror is the front door**

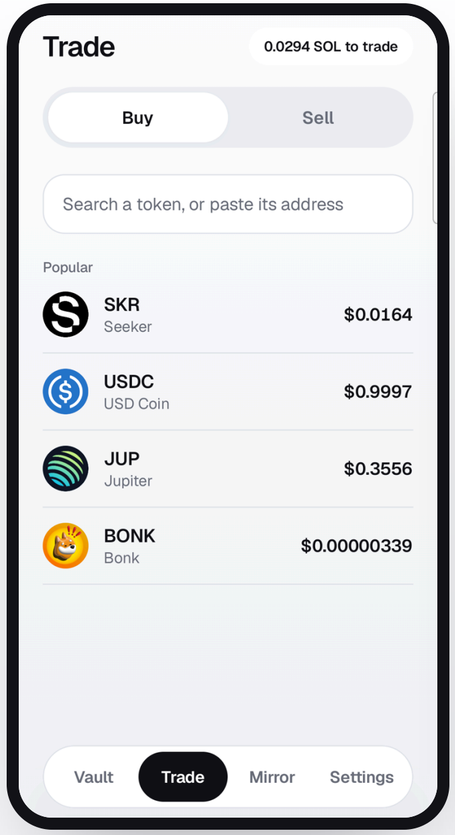

Paste any wallet and see its own gap between won and kept. No sign up.

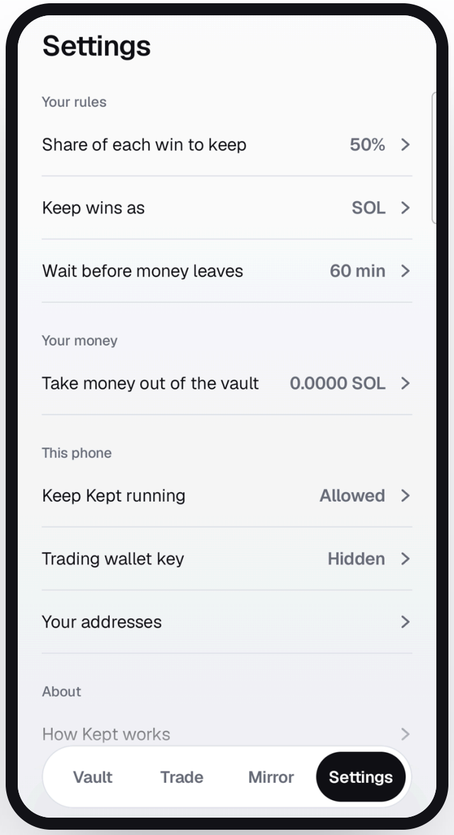

2 **One setup, then nothing to do**

After that the only touch is a notification that a win was kept.

3 **A number that only goes up**

Each win lights another glass step. Kept takes nothing from a win.

Try it now

Paste any wallet. See what you *kept.*
